

Catch-distance to reaction-time strip

A partner holds the meter stick at the TOP so it hangs straight down with the 0 cm mark level with your open fingers. They release it without warning; you pinch it as fast as you can. Read the cm where you caught it, then look it up below. Record the **median of at least 10 trials**, not your best one. Then test one strategy (focus cue, warm-up, or eyes on the release point) and compare medians.

CM CAUGHT	REACTION (MS)
2	64
4	90
6	111
8	128
10	143
12	156
14	169
16	181
18	192
20	202

CM CAUGHT	REACTION (MS)
22	212
24	221
26	230
28	239
30	247
32	255
34	263
36	271
38	278
40	286

Formula: $\text{time} = \sqrt{2 \times \text{distance} \div g}$, $g = 9.81 \text{ m/s}^2$. Lower is faster. Typical 8 to 12 year olds land near 18 to 31 cm (about 190 to 250 ms).
